

Repairing Fragmented Care

Identifying fragmented care in the SVH network and mapping how it creates longer, more complex patient journeys, across specialists, services, and geography

Fragmented Patients Move Through the SVH Care Network

We define **care fragmentation** as how widely a patient's journey moves across specialties, departments, providers, diagnoses, and visit types.

Fragmentation Increases Across Every Care Dimension

CareGraph: Fragmentation Groups Reveal Different Care Pathway Intensities

Patient segments

Specialties

Visit types

Edge thickness reflects encounter volume. Blue edge shade shows the originating fragmentation group; darker blue indicates higher fragmentation.

Low flow Medium-low flow Medium-high flow High flow Specialty Visit type

Takeaway: High-fragmentation patients are not just higher-volume patients. They move through more specialties, providers, diagnoses, and visit types, creating a visible care-navigation risk group for earlier **coordinated care support**.
